The sequences given in AAR96301-417 are non-naturally occurring RGD-containing peptides which alter the alpha-v, beta-3 integrin receptor binding of a cell to a matrix, such as the binding of an osteoclast to a matrix, such as bone. These peptides inhibit bone resorption and can inhibit or promote alpha-v, beta-3-mediated cell attachment depending on whether they are present in the cell in a soluble form or are bound to a solid substrate. These peptides can be used in the amelioration of the severity of a pathology involving alpha-v, beta-3 receptor-mediated binding of a cell, such as an osteoclast, endothelial cell or smooth muscle cell to a matrix. They are used for treating conditions associated with restenosis or inappropriate or insufficient angiogenesis, or for inhibiting osteoclast binding to the matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         bone resorption; pharmacore; angiogenesis; restenosis; integrin receptor; alpha v beta 3 integrin receptor; osteoclast; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new method is claimed for altering bone resorption. It comprises medninistration of a peptide of formula: X1XZXXXKGDXXXXXXR where X1 = R1R2N or 0-10 amino acids (optionary protected by acetylation at the N-terminus); X2 = absent or 1 amino acid; X3 = absent or 1 or 2 amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of peptide derivatives which can alter integrin receptor binding for altering bone resorption, treating angiogenesis or restenosis and altering integrin receptor mediated interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

ö
integrin receptor, or is Msa, Psa or Tfsa; X6 = residue which has an aliphatic side chain; a non-natural amino acid that is hydrophobic; or aliphatic side chain; a non-natural amino acid that is hydrophobic; or Thr; X7 = a residue capable of forming a bond (1) with a bridging amino acid of X2, (iii) with X3 when X2 is absent, or (iii) with X4 when X2 and X3 are absent, to conformationally restrain the peptide; X8 = NR3R4; OR5; Or 0-10 amino acids, optionally protected as an amide at the C- terminus; R1, R3-R5 = H or alkyl; R2 = H, alkyl, alkyl-CO or phenyl-CO. The peptides are useful for inhibiting bone receptor-mediated interactions, especially alpha v beta 3 integrin receptor-mediated interactions, especially alpha v beta 3 integrin receptor-mediated binding of cells to a matrix. They may be used for reducing or inhibiting osteoclast binding peptide disclosed in the specification. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present peptide represents a non-naturally occurring Arg-Gly-Asp (RGD)-containing peptide. The peptide may be useful for reducing or inhibiting bone resorption, angiogenesis or restenosis, and for altering an integrin receptor mediated interaction. The peptide may also be used to inhibit the binding of an osteoclast to bone
                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide used to inhibit bone resorption, angiogenesis and restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RGD peptides - that modulate integrin-mediated cell-matrix binding

They are used for treating conditions associated with restenosis or inappropriate or insufficient angiogenesis, or for inhibiting osteoclast binding to the matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR96301-417 are non-naturally occurring RGD-containing peptides which alter the alpha-v, beta-3 integrin receptor binding of a cell to a matrix, such as the binding of an osteoclast to a matrix such as bone. These peptides inhibit bone resorption and can inhibit or promote alpha-v, beta-3-mediated cell attachment depending on whether they are present in the cell in a soluble form or are bound to a solid substrate. These peptides can be used in the amelioration of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Altering alpha-v, beta-3 integrin receptor-mediated binding of cell to matrix - using conformationally restrained peptide of RGD type, e.g. for treating inappropriate angiogenesis or for inhibiting bone resorption.
                                                                                                                                                                                                                                                                                                                       RGD-containing peptide; alpha-v, beta-3 integrin receptor; osteoclast; matrix; bone; inhibition; bone resorption; promote; endothelial cell; smooth muscle cell; restenosis; angiogenesis; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Revised record issued on 21-OCT-2004 : Correction to Feature Table Key

                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new method is claimed for altering bone resorption. It comprises administration of a peptide of formula: X1X2X3X4GDX5X6X7X8; where X1 = R1R2N or 0.0-10 amino acids (optionally protected by acetylation at the N-terminus); X2 = absent or 1 amino acid; X3 = absent or 1 or 2 amino acids integrin receptor, or 18 Msa, psa or Tfsa; X6 = residue which has an all integrin receptor, or 18 Msa, psa or Tfsa; X6 = residue which has an acid of X2, (ii) with X3 when X2 is absent, or (iii) with A4 when X2 and X3 are absent, to conformationally protected as an amide at the C-terminus; C 10 amino acids, optionally protected as an amide at the C-terminus; or 0-10 amino acids, optionally protected as an amide at the C-terminus; C 11, R3-R5 = H or alkyl, alkyl, alkyl-CO or phenyl-CO. The peptides are useful for inhibiting bone resorption, angiogenesis or restenosis, and for altering integrin receptor-mediated interactions, especially alpha v beta 3 integrin receptor-mediated binding of cells to a matrix. They may be used for reducing or inhibiting osteoclast binding to a matrix. They may be used for reducing or inhibiting osteoclast binding to a matrix. The present sequence is shown in the specification. (Updated

```

```
The present peptide represents a non-naturally occurring Arg-Gly-Asp (RGD)-containing peptide. The peptide may be useful for reducing or inhibiting bone resorption, angiogenesis or restenosis, and for altering an integrin receptor mediated interaction. The peptide may also be used to inhibit the binding of an osteoclast to bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                             Peptide used to inhibit bone resorption, angiogenesis and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies contacting the accivity of P. acnes polypeptides and activity of P. acnes polypeptides and determining P. acnes presence, for example, by charge linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

encoding a Propionibacterium acnes protein. The invention also relates to polympotides encoded by the polymucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a colympotide of the invention; and invention; and an isolated T cell population comprising T cells prepared to invention; fusion proteins comprising a polypeptide of the invention; and an isolated T cell population comprising T cells prepared to polympotides, and an isolated T cell population comprising T cells prepared to and an isolated T cell population comprising T cells prepared to an expression antipodies, fusion proteins, T cell populations, or considerable to a considerable to a subsence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a considerable to proteins. T cell populations or antigen-presenting cells that express the polympotides are useful for diagnosing, preventing or treating acnes proteins, or for stimulating an immune response specific for a P. acnes to protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acnes continued the kit is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present contained within the P. acnes polympotide to be encoded by an ORF (open tending frame) contained within the P. acnes polympotide to the prince data for thing patent did not form part of invention. Note: The sequence data for this patent did not form and the prince of the prince data for this patent did not form and present to invention. Note: The sequence data for the sequence data for the prince of the prince of the prince of the prince of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.

Claim 27; SEQ ID NO 1084; 591pp; English.

The invention relates to novel human diagnostic and therapeutic

polynucleotides designated dithp (ACC46080-ACC46749) and to their encoded

proteins (DITHP, ABRAH135-ABRAH121). The invention also relates to

polynucleotide sequences at least 90% identical to the dithp CDNA

sequences of the invention; recombinant vectors, host cells and

cransgenic organisms comprising althp nucleic acid sequences; the

recombinant production of DITHP proteins; antibodies specific for DITHP

proteins; microarrays comprising dithp nucleic acid sequences; methods of

recombinant production of DITHP proteins; antibodies specific for DITHP

crecombinant production of DITHP protein; and methods of

assessing the toxicity of test compounds using a dithp hybridisation

compounds which specifically bind a DITHP protein; and methods of

assessing the toxicity of test compounds using a dithp hybridisation

crecompounds which specifically bind a DITHP protein; and other cell

compounds which specifically bind a DITHP protein; and other cell

compounds which specifically binds and DITHP protein; and other cell

compounds which specifically binds and bithp hybridisation

compounds which specifical disorders; antoimmune or inflammatory disorders; metabolic

compounds which specifical disorders; partoimessinal disorders; metabolic

concell type and connective tissue disorders. They may also be used to

screen for modulators of protein activity or gene expression. DITHP

concell type and to induce antibodies. The dithp nucleic acids are

additionally useful in somatic or germline gene therapy of the disorders

cor cell type and to induce antibodies. The dithp nucleic acids are

cor cell type and to induce antibodies. The dithp nucleic acids are

cor cell type and to induce antibodies. The dithp nucleic acids are

cor cell type and to induce antibodies. The dispense sequences or knock in

cor cell type and to induce antibodies and primers, in genocyphing and induce the generation of transgenic animal models of humanised animals, in convec of an

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by E. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes Is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies contacting the convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as disgnostic agents for determining P. acnes presence, for example, by chips patent did not form part of the printed specification, but was

The invention relates to an isolated polynuclectide (ACF64435-ACF64733)

chooding a Propionibacterium acnes protein. The invention also relates to polypeptides aeroaded by the polynucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a colymputiclectide of the invention; antibodies against polypeptides of the invention are propertion and an isolated T cell population comprising T cells prepared to hydpoptide and an isolated T cell population comprising T cells prepared to polymptides, antibodies, fusion proteins, T cell populations, or configurable to the invention; and this method; a vaccine composition (comprising T cell populations) or antigen-presenting cells that express the polypeptide, antibodies, fusion proteins, T cell populations or determining the presence or absence of P. acnes in a configuration of patient; and a method for inhibiting the development of P. acnes in a configuration or determining the presentence or absence of P. acnes in a proteins. T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acnes to proteins, T cell populations or antigen-presenting or treating acnes or protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the atting acnes, or for treating acnes, cutimulating an immune response against P. acnes, or for treating acnes.
                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatorropic, vulnerary; antiparatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiporialic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antimathic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antitinflammatory; antibacterial; antiviral; antithungal; antitheumatic; antithyroid; an antianaemic. The sequences can be used for determining the presence of or predisposition in or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative used to treat cancers, proliferative disorders, cardiovascular disease, cancers, proliferative disorders, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency
                                                                                                                                                                                                                                                                                                    immunostimulant; thrombolytic; coagulant; vasctropic; antidabetic; impupotensive; dermatological; immunosuppressive; antiinflammatory; antiviral; antibacterial; antifungal; anticheumatic; antiinflammatory; antiviral; antibacterial; antifungal; anticheumatic; antithyroid; antiansemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovescular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation; thrombosis; contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              요
                                                                                                                                                                                                                                                                                           The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid cor nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with numan disease, which includes a pathology associated treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and colypeptide are especially useful for treating or preventing e.g. diabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, vasting disorders, Alzheimer's disease, cancer), dyslipidemias, anorexia, cardiomyopathy, AlDS, asthma, Crohn's disease, multiple sclerosis, hypertension atherosclerosis, hemophilia, carefully the sclerosis, hypertension, atherosclerosis, hemophilia, graft-versus-host disease or Albright hereditary osteodystrophy. The DNA conditions. These are also useful in gene therapy for treating the above conditions. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic and analysis of various human disorders, as well as in diagnostic and an analysis and the part of the NOVX proteins of the

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant series and in mproved property. The plant is a crop plant combinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant with the crombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with insproved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme semotic conditions, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plants production or improved gladactomannan providing improved plants of conditions of providing increased in the production. This sequence represents a bacterial polypeptide used in the scope of the printed specification but was obtained in electronic form and the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant with the method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a plant with the recombinant DNA construct and growing the transformed plant where the polypeptide or properties is useful for improving plant with the recombinant DNA construct is useful for improving plant with improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress content, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the printing stream of the printing incomparation but was obtained in electronic forms from the part of the printing incomparation but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                  New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

time inventional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct and growing the transformed plant where the recombinant DNA construct is useful for improving plant where the collymotoed for polypuclectide or polypeptide is useful for producing plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, collerance to herbicides, extreme communic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lightin production or improved glad condition or production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form of form of the form of the printed specification but was obtained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                               This is the amino acid sequence of human mature phosphatidic acid phosphatiae-beta (PAP-beta), an enzyme that catalyses the conversion of phosphatidic acid into diacylglycerol. 3 Variants of human PAP, i.e. PAP-beta (abha 1 and 2 (see AAW79284-85), PAP-beta (see AAW79286) and PAP-gamma (see AAW79287) have been identified. The invention provides PAP-gamma (see AAW79287) have been identified. The invention provides PAP polypeptides, a method of preparing PAP in a transformed host cell, and a method of using PAP to dephosphorylate a substrate, especially lysophosphatidic acid, ceramide 1 phosphate or sphingosine 1-phosphate, particularly for production of diacylglycerol, but also monoacylglycerol, ceramide and sphingosine. PAP is able to control the balance of lipid mediacors of cellular activation and signal transduction. Sequences that encode PAP are potentially and signal transduction. Sequences that encode PAP are potentially subpressors, PAP-alpha is expressed at lower levels in cancer cells than control of anoamal cells of same tissue type), inflammatory disease and diabetes-

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chart issue of a first animal chart increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neutonal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound cor identifying a compound or small molecule that regulates the activity of one or more of the composition of specification, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating complained by a composition comprising the one or more of the compound that end a pharmaceutical composition comprising the one or more compound that end a pharmaceutical composition comprising the compound that colypeptides or their antibodies. The polyperides or the compound that colypain (e.g. spinal sequence presented is a human protein (shown in Table 2 of the rarapy). The sequence date for this patent did not form part of the printed form patent did not form part of the printed form was obtained in electronic form directly from WIPO at specification, but was obtained in electronic form directly from WIPO at the polyperides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PRO; antiinflammatory, antiarthritic; antirheumatic; immunosuppressive; osteopathic; antidiabetic; dermatological; antipsoriatic; antiallergic; antiasthmatic; hepatotropic; respiratory; gene therapy; immune system.
                                                                                                                                                                                               New PRO nucleic acid or polypeptide, useful for preparing a
pharmaceutical composition for diagnosing or treating psoriasis in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated nucleic acid and the PRO

polypeptide encoded by it. A protein of the invention has antiinflammatory, antiarthritic, antirheumatic, immunosuppressive, cartifalberic, dermatological, antipportatic, antiallergic, antiasthmatic, hepatotropic, and respiratory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the companies, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, incopathic inflammatory myopathy, Sjogran's syndrome, systemic selerosis, and ideopathic inflammatory myopathy, Sjogran's syndrome, autoimmune crowing control of the manacory demyelinating polymeuropathy, Guillain-Barre syndrome, system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, control of inflammatory demyelinating polymeuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary cliflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, an autoimmune or immune-mediated skin disease, a sthma, allergic rhinitis, atopic dermatitis, food disease, asthma, allergic rhinitis, atopic dermatitis, psoriacis, an allergic chinitis, atopic dermatitis, psoriacis, an atransplantation associated disease, graft rejection or content of the present sequence represents a PRO protein of the late.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological
The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.

```
pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism actes, (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underspressed; (12) determining the extent trains or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for callular proliferation to isolate candidate molecules for rational for discovery programs, or for screening homologous nucleic acids required for proliferation in calls other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the property of the printed specification, but was obtained in electronic format directly from WIPO at

cc nucleic acid; (2) a host cell containing the vector; (3) an isolated publipatide of utle fragment whose expression is inhibited by the nucleic acid; (2) a host cell containing the vector; (3) an isolated controlled by the antibody capable of specifically binding the polypeptide of the polypeptide; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway.

Cc required for proliferation, or that inhibits proliferation of an identifying a gene required for cellular proliferation of an organism and antibiotic; (10) profiling a compound a acts; (9) manufacturing an antibiotic; (10) profiling to compound's activity; (11) a culture comprising strains in which the gene or which her test compound that inhibits proliferation of a compound; (2) determining the extent ct owhich each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the confidentifying proteins or screening for homologous moleic acids required for proliferation to isolate candidate moleic acids required for proliferation to isolate candidate moleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence data for this required form part of the printed specification, but was obtained in electronic format directly from MIPO at the laction, but was obtained con in electronic format directly from MIPO at the present data for this

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid mucleic acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product is gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism sets; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is pressent in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the culture or collection of a proliferation or solates are nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are quired for cellular proliferation of solate candidate molecic acids are quired for displace and delated promolectic acids are quired for delated promolectic acids are quired for del
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the antisense acquences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid cucleic acid; (2) a host cell containing the vector; (3) an isolated cucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cell polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agenome that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological corpact a gene on which the test compound that inhibits sproliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the extent compound that inhibits proliferation of an organism; (12) determining the extent of the which each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for confidence or for strains and activity and activity of a compound that inhibits are negatived or dentifying proteins or screening for homologous nucleic acids required for for cellular proliferation of an organism. The antisense modeled acids required for cellular proliferation of an organism. The antisense modeled acids required for cellular proliferation of an organism and the sequence of a compound that inhibits and acids required for the cellular p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                       ö
                                                                                                                                                                                           The invention describes a new isolated nucleic acid encoding a Klebsiella pheumoniae polypetide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression exector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                              New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.

The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plants with the recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptask, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactemannan condition, improved lignin production or improved galactemannan coppedition part of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequence (ABLIG176-ABLIG11), expressed DNA sequences (ABLO1840-ABLIG175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

These peptides inhibit bone resorption and can inhibit or promote alpha-v, beta-3-mediated cell attachment depending on whether they are present in the cell in a soluble form or are bound to a solid substrate. These peptides can be used in the amelioration of the severity of a pathology involving alpha-v, beta-3 receptor-mediated binding of a cell, such as an osteoclast, endothelial cell or smooth muscle cell to a matrix. They are used for treating conditions associated with restenosis or inappropriate or insufficient angiogenesis, or for inhibiting osteoclast binding to the matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Altering alpha-v, beta-3 integrin receptor-mediated binding of cell to matrix - using conformationally restrained peptide of RGD type, e.g. for treating inappropriate angiogenesis or for inhibiting bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                   RGD-containing peptide; alpha-v, beta-3 integrin receptor; osteoclast; matrix; bone; inhibition; bone resorption; promote; endothelial cell; smooth muscle cell; restenosis; angiogenesis; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Revised record issued on 21-OCT-2004 : Correction to Feature Table Key
printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new method is claimed for altering bone resorption. It comprises
administration of a peptide of formula: XX2XXX4GDXSXXXX; where XI =
R1R2N or 0-10 amino acids (optionally protected by acetylation at the N-
terminus); X2 = absent or 1 amino acid; X3 = absent or 1 or 2 amino acids
iX4 = N-Me-Arg; X5 = residue which provides an ionic interaction with an
integrin receptor, or is Msa. Psa or Tfsa; X6 = residue which has an
ilphatic side chain; a non-natural amino acid that is hydrophobic; or
Thr; X7 = a residue capable of forming a bond (1) with a bridging amino
acid of X2, (1) with X3 when X2 is absent, or (iii) with X4 when X2 and
X3 are absent, to conformationally restrain the peptide; X8 = NR3R4; OR5;
or 0-10 amino acids, optionally protected as an amide at the C- terminus;
CC Peptides are useful for inhibiting bone resorption, anglogenesis or
restenosis, and for altering integrin receptor-mediated binding of cells to
especially alpha v beused for reducing or inhibiting osteoclast binding
to a matrix. They may be used for reducing or inhibiting osteoclast binding
to a matrix. The present sequence represents an example of a circular
properties are useful for inhibiting or of a circular
copetide disclosed in the specification. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present peptide represents a non-naturally occurring Arg-Gly-Asp (RGD)-containing peptide. The peptide may be useful for reducing or inhibiting bone resorption, angiogenesis or restenosis, and for altering an integrin receptor mediated interaction. The peptide may also be used to inhibit the binding of an osteoclast to bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide used to inhibit bone resorption, angiogenesis and restenosis.

                                                                                                                                                                                                                                               AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially.
                                                                                                                                                                                         Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                            cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK84649 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAW3169 represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                               The invention describes a new isolated nucleic acid encoding a Klebsiella pheumoniae polypetide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I); its
                                                                                                                                                                         New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.

```
complement, degenerate variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polymucleotide that is comprising the expression vector; (6) a pharmaceutical composition comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising the polypeptides of (1), their biological equivalent or fragment; (8) immunising against Alloiococcus otitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (10) a kit comprising a container containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions witable to produce the polypeptides polypeptides, and compositions of the present investion can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The present sequence represents an Alloiococcus otitidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Swarnakar A, Griffin JA, Lee EA, Sprague WW;

                                                                                               New human protein modification and maintenance molecules (PMMM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMMM expression e.g. cancer, AIDS, epilepsy, or
                                                                                                                                                                                                                                                             cytostatic, antiarteriosclerotic, anticonvulsant, nootropic, neuroprotective, cerebroprotective, vasotropic, anti-missing antimicrobial, antiinflammatory, endocrine-Gen or thyromimetic activity. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of PMMM, such as cell proliferative (for example cancer, atherosclerosis), neurological (for example epilepsy, Huntington's disease, stroke), immune/inflammatory (for example AlbS, allergies) and developmental (for example Hypothyroidism, Cushing's syndrome) disorders, or infections. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of PMMM. The present sequence is that of a human PMMM protein of the invention.

                                                                                                                                                                                                                                                                            ö
                                 The invention relates to a novel isolated polypeptide comprising an amino acid sequence that has greater than 95 % identity to any one of 47 150-350 residue procease polypeptide sequences, given in the specification. The nucleic acids, probes, primers, polypeptides and antibodies of the invention can be used in methods of diagnosis of a susceptibility to a disease or condition associated with a protease. The present sequence represents a protease of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activity, caleosin-like activity, LIPI5-like transcribtion factor activity, caleosin-like activity, ATP citrate lyase activity, SNF1-like complement (II) of (I); (2) a chimeric construct (III) comprising (I) or (III), operably linked to a regulatory sequence; (3) a plant (IV) comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rice

inhibition or co-suppression in a transformed plant. (III) is useful for altering the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SA, Swarnakar A, Elliott VS, Marquis JP;

The DNA and protein sequences of the invention are useful for the diagnosis and treatment of disorders associated with expression of PMMM, such as: gastrointestinal disorders (e.g. peptic ulcer and Crohn's disease),
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to an isolated Protein Modification and Maintenance (PPMM) polypeptide. Polypeptides of the invention may be used in the diagnosis, treatment and prevention of disorders associated with decreased expression or activity of PPMM. These include gastrointestinal decreased expression or activity of PPMM. These include gastrointestinal disorders (e.g. crohn's disease), cardiovascular disorders (e.g. anaemial, cell proliferative disorders, developmental disorders, epithelial disorders (e.g. scables), neurological disorders (e.g. Alzheimer's disease)

CC (e.g. scables), neurological disorders (e.g. Alzheimer's disease)

CC reproductive disorders (e.g. ectopic pregnancy), and in gene therapy or a cryscoductive disorders (e.g. Alzheimer's disease)

CC vaccine for such diseases. They may also be used in the assessment of the effects of exogenous compound on the expression of nucleic acid and amino card sequence represents a human PPMM of the invention, which has been current sequence represents a human PPMM of the invention, which has been found to have homology with mouse ubiquitin specific procease. The gene encoding this polypeptide has been localised to chromosome 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiparkinsonian, nootropic; neuroprotective; neurodegenerative;

(I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                 ö
atrophy, as well as in gene therapy applications. The current sequence is that of the human ubiquitin-specific protease of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, chromosome mapping, gene mapping, gene therapy, forensic,

```
The invention relates to a composition that alters the expression of human ubiquitin protease 8 (hUBP8; also known as ubiquitin specific protease 22, UBp22 or USP22; ADIS4836 or its homologue, and reduces, eliminates or uspace; ADIS4836 or its homologue, and reduces. Composition is preferably a double-stranded RNA with a sense and cartisense regions, or a protein ligand of humsps such as an antibody or fragment thereof, which are capable of inhibiting hUBP8 expression. HUBP8 is required for chromatin development and regulation of genes in the histone-modifying SAGA complex, particularly histone H2B. Overexpression of hUBP8 cart result in overproduction of certain genes such as oncogenes, while reduced hUBP8 enzymatic activity may reduce the production of tumour suppressor proteins. The invention also relates to an expression construct encoding hUBP8; methods of identifying modulators of hUBP8 activity or expression; a method of determining the tumorigenic potential in a cell; a method of assessing the sensitivity of a tumour cell to an expression of a gene that relies upon deubiquitylation for the expression of a gene that relies upon deubiquitylation for transcription. The hUBP8 modulatory compositions of the invention are
                                                                                                                                                                                                                                                                                                                           Human; hUBPB; ubiquitin protease 8; ubiquitin specific protease 22; Ubp22; USP2; USPB homologue; deubiquitylation; histone H1B; histone modification; transcriptional regulation; USPB modulator; drug screening; tumoriganic operential; cancer cell sensitivity; cancer; tumour; inflammation; viral infection; fungal infection; hypercholesterolaemia; cytostatic; antiinflammatory; virulioide; fungal infection; hypercholesterolaemia; cytostatic; antiinflammatory; virucide; fungicide; nootropic; neuroprotective; anti-H1V; antilipaemic; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A composition altering the expression of human ubiquitin protease 8, for treating or diagnosing a disease associated with the expression of a gene that relies upon deubiquitylation for transcription, e.g. inflammation or
                                                                                                                                                                                                                                                                                      Human ubiquitin protease 8 (hUBP8/Ubp22), SEQ ID NO:1.

useful for treating or diagnosing a disease associated with the expression of a gene that relies upon debubiquivtylation for transcription, e.g. inflammation, viral infection, fungal infection, cancer, Alzhehmer's disease, HIV infection or hypercholesterolaemia. The composition is also tunesful in rendering a cancer cell more sensitive to additional antitumour therapies, and in determining whether a cell is tumorigenic. The present sequence represents HUMBB/UDp22 which is referred to in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,

antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, luga cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide of the invention

Rosen CA, Barash SC, Ruben SM

WPI; 2001-465566/50. N-PSDB; AAS41075.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.

Claim 11; SEQ ID NO 1201; 1180pp; English

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. paemophila), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynuclectides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print format of the print format directly from wipo int/pub/published\_pot\_sequences

```
The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with abserrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine. CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                  New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and andocrine. CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                      Agee ML, Anderson DW, Berghs C, Casman SJ, Catterton E;

polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the

The invention relates to a composition that alters the expression of human ubiquitin protease 8 (hUBP8; also known as ubiquitin specific protease 22, UDp22 or USP22; ADH54836) or monloque, and reduces, eliminates or enhances its deubiquivylating activity in a cell. The composition is preferably a double-stranded RNA with a sense and composition is preferably a double-stranded RNA with a sense and risense regions, or a protein ligand of hUBP8 such as an antibody or fragment thereof, which are capable of inhibiting hUBP8 expression. HUBP8 is required for chromatin development and regulation of genes in the histone-modifying SAGA complex, particularly histone H2B. Overexpression of hUBP8 can result in overproduction of certain genes such as oncogenes, while reduced hUBP8 enzymatic activity may reduce the production of tumour suppression proteins. The invention also relates to an expression construct encoding hUBP8; methods of identifying modulators of hUBP8 activity or expression; a method of determining the tumorigenic potential

ö
in a cell; a method of assessing the sensitivity of a tumour cell to an agent that disrupts deubiquitylation; retarding the growth of a cancer cell; and a method of treating or diagnosing a disease associated with the expression of a gene that relies upon deubiquitylation for transcription. The hUBPS modulatory compositions of the invention are useful for treating or diagnosing a disease associated with the expression of a gene that relies upon deubiquitylation for transcription, e.g. inflammation, viral infection, ungal infection, cancer, Alzheimer's disease, HIV infection or hypercholesterolaemia. The composition is also useful in rendering a cancer cell more sensitive to additional antitumour therapies, and in determining whether a cell is tumorigenic. The present sequence represents human KIAA1063 protein, which consists of the hUBPS UDp22 amino acid sequence (ADH54836), plus an additional 68 N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual determining the tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The mucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and thereto polymucleotides encoding them. The sequences are useful in diagnosis and the pathological conditions, as molecular targets for diagnostice, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as regets for antibacterial drugs, including anti-P. aeruginosa drugs, se templates for recombinant production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequence Ab067826-Ab08436 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                   Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

modification and maintenance molecules (PMMM), and the polymucleotide

modification and maintenance molecules (PMMM), and the polymucleotide

sequences encoding them. A total of 40 PMMM polypeptides (designated PMMM - 1 to PMMM-40) are disclosed. The sequences of the invention are useful

for diagnosting a condition or disease associated with the expression of PMMM in a subject, preparing a polyclonal or monoclonal antibody, and comparating an expression profile of a sample containing the expression or overexpression of PMMM are cell proliferation disorders (c.g. polymucleotides. The diseases or conditions associated with decreased expression or overexpression of PMMM are cell proliferation disorders (c.g. epilepsy, Huntington's disease, stroke), immune/inflammatory disorders, (e.g. allorgies), developmental disorders (e.g. hypothyroidism, Cushing's allargies), developmental disorders (e.g. hypothyroidism, Cushing's PMM polypeptides or their fragments are useful in screening compounds for the fetchiveness as agonists or anteagonists of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to, or modulate the activity of the polypeptide. New human protein modification and maintenance molecules (PMMM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMMM expression e.g. cancer, atherosclerosis, or Tran UK, Becha SD, Duggan BM, Lee EA, Griffin JA, Li JX; Sprague WW, Hafalia AJA, Chawla NK, Lehr-Mason BM, Kable AE, Yue H; Marquis JP, Yao MG, Richardson TW, Tang TY, Jin P, Chien D; Bhatta U, Burrill JD, Lee S, Blake JJ, Ho A, Zheng W; Human, protein modification and maintenance molecule, PMMM, cancer, cell proliferation disorder; atherosclerosis, neurological disorder; epilepsy, Huntington's disease, stroke, immune disorder; allergy, inflammatory disorder, AIDS, developmental disorder; hypothyroidism, Cushing's syndrome, gastrointestinal disorder; epithelial disorder; infection; cytostatic; antiarteriosclerotic; anticonvulsant; nootropic, neuroprotective; cerebroprotective; anti-HIV; antiallergic; vulnerary; Lee SY; Human protein modification and maintenance molecule-7 (PMMM-7). ```
The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders unch as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. inflammatory diseases and asthma), relations or neuronal-associated diseases, metabolic coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory diseases (e.g. diabetes, obesity), inflammatory disorders (e.g. cheumatoid arthritis and psoriasis), central or peripheral nervous system disorders, cognition disorders, hypotension, mood disorders, attention disorders, neurological disorders, hypotension, hypotension, psychotic disorders, neurological disorders, hypotension, hypotension, psychotic disorders, neurological disorders, hypotension, hypotension, psychotic disease) and dyskinesias. The mucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel
                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, protease, cancer, immune-related disorder, cardiovascular disease, neuronal-associated disease, metabolic disorder; inflammatory disorder; nervous system disorder, sexual dysfunction; pain; mood disorder; hypertenator, psychotic disorder; neurological disorder; dyskinesia; hypertenaton; psychotic disorder; neurological disorder; dyskinesia; viral infection; human immunodeficiency virus; HIV; non-viral infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polynucleotides and polypeptides of the invention are useful in the diagnosis, treatment and prevention of gastronictestinal e.g. gastritis, esophageal carcinoma and Crohn's disease, cardiovascular e.g. atherosclerosis, hypertension and myocardial infarction, autoimmune/inflammatory e.g. acquired immunodeficiency cancer, developmental e.g. becoarthritis, call proliferative e.g. cancer, developmental e.g. buchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infertility and endometriosis disorders. Numerous other examples of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-21
                                                                                                                                                                                                                                                                                                                                                          Human; protease; PRTS; gastrointestinal; Crohn's disease; cancer; cardlovascular; atherosclerosis; autoimmune disorder; dermatitis; inflammatory disorder; acquired immunodeficiency syndrome; AIDS; cell proliferative disorder; developmental disorder; epilepsy; Duchenne muscular dystrophy; epithelial disorder; neurological disorder; reproductive disorder; endometriosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Twenty one human proteases (referred to as PRTS-1 to PRTS-21), useful in the diagnosis, treatment and prevention of gastrointestinal (e.g. gastritis), cardiovascular (e.g. atherosclerosis) and cell proliferative (e.g. cancer)disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Yue H, Elliott VS, Gandhi AR, Lal P, Au-Young J, Tribouley CM; Delegeane AM, Baughn MR, Nguyen DB, Lee EA, Hafalia A, Khan FA; Walia NK, Yao MG, Lu DAM, Patterson C, Tang YT, Walsh RT; Azimzai Y, Lu Y, Ramkumar J, Xu Y, Reddy R, Das D, Kearney L; Kallick DA;

These peptides inhibit bone resorption and can inhibit or promote alpha-v, beta-3-mediated cell attachment depending on whether they are present in the cell in a soluble form or are bound to a solid substrate. These peptides can be used in the amelioration of the severity of a pathology involving alpha-v, beta-3 receptor-mediated binding of a cell, such as an osteoclast, endothelial cell or smooth muscle cell to a matrix. They are used for treating conditions associated with restenosis or inappropriate or insufficient angiogenesis, or for inhibiting osteoclast binding to the matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Altering alpha-v, beta-3 integrin receptor-mediated binding of cell to matrix - using conformationally restrained peptide of RGD type, e.g. for treating inappropriate angiogenesis or for inhibiting bone resorption.
                                                                                                                                                                                                                                                                                                                         RGD-containing peptide, alpha-v, beta-3 integrin receptor; osteoclast; matrix; bone; inhibition; bone resorption; promote; endothelial cell; smooth muscle cell; restenosis; angiogenesis; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Revised record issued on 21-OCT-2004 : Correction to Feature Table Key

A new method is claimed for altering bone resorption. It comprises administration of a peptide of formula: XIXXXXXGDXSKXXX8; where XI = RIRZN or 0-10 amino acids (optionally protected by acetylation at the N-terminus); X2 = absent or 1 amino acid; X3 = absent or 1 or 2 amino acids in X4 = N-Me-Arg; X5 = residue which provides an ionic interaction with an integrin receptor, or is Max, Psa or Tfsa; X6 = residue which has an integrin receptor, or is Max, Psa or Tfsa; X6 = residue which has an integrin receptor, or is Max, Psa or Tfsa; X6 = residue which has an integrin receptor, or is Max, Psa or Thr; X7 = a residue capable of forming a bond (i) with a bridging amino acid for X2, (ii) with X3 when X2 is absent, or (iii) with X4 when X2 and C6 and a beent, to conformationally restrain the peptide; X8 = NR3R4; OR5; Or 0-10 amino acids, optionally protected as an amide at the C-terminus; C7 peptides are useful for inhibiting bone resorption, angiogenesis or restenosis, and for altering integrin receptor-mediated binding of cells to a matrix. They may be used for reducing or inhibiting osteoclast binding to a matrix. They may be used for reducing or inhibiting osteoclast binding to a matrix. The present sequence represents an example of a circular peptide disclosed in the specification. (Updated on 25-MAR-2003 to

The invention relates to nucleic acid molecules encoding rev-caspases.

Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences an AAY21734 -AAY21795 represent conserved peptide sequences in various

                                                                                                                                                                                                                                                                                                                                                                    The present peptide represents a non-naturally occurring Arg-Gly-Asp (RGD)-containing peptide. The peptide may be useful for reducing or inhibiting bone resorption, angiogenesis or restenosis, and for altering an integrin receptor mediated interaction. The peptide may also be used to inhibit the binding of an osteoclast to bone
                                                                      Peptide used to inhibit bone resorption, angiogenesis and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Wch6). Mch6 is a member of the aspartate-specific cysteline protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for disease or cerebellar degeneration). The Mch6 sequence is useful for diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is a fragment of ICH-1 peptide which belongs to NEDD-like subfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; caspase; rev-caspase; gene therapy; protease; apoptosis; cancer; autoimmune disease; cytostatic; immunosuppressive.
                                                                                                                                                                                                                                                                                                                                                        New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This invention relates to novel peptides capable of modulating apoptotic cell death. In particular, the invention relates to the molecular cell death. In particular, the invention relates to the molecular extructures of the apoptotically active site of human alpha-fetoprotein and human serum albumin. The invention may be useful for the development of compounds with an immunosuppressive or virucide activity acting as apoptosis signaling modulators. The peptide structures are useful for suppressing apoptotic regulatory pathways in human and anmal cells, for increasing apoptotic regulatory pathways in human and anmal cells, for increasing apoptotic regulatory pathways in human and anmal cells, for increasing preservation of organs or cells within their transplantation, for preventing of autoimmune disorders and an immunodeficiency syndrome induced by a viral infection, for lowering cytotoxic effects after chemo or radiotherapy, for inhibiting neuronal cell apoptosis, non-specific preventing apoptosis of cultured cells prepared for scientific or technical purposes. The present sequence is that of a human caspase-2 peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a multimer that binds to a target molecule, comprises identifying at least one monomer domain that bind to at least one target molecule and linking the identified monomer domains to form a library of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to identifying a multimer that binds to a target molecule, comprising identifying at least one monomer domain that binds to at least one target molecule, linking the identified monomer domains to form a library of multimers, each multimer comprising at least two monomer domains, and screening the library of multimers for the ability

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ŋ
```

```
c to bind to the first target molecule. Also included are: (1) a library of multimers formed by the method above (where each multimer comprises at least two monomer domains connected by a linker, and each monomer domain exhibits a binding specificity for a target molecule); (2) a polypeptide comprising: (a) the multimer selected from the novel method; or (b) at least two monomer domains separated by a heterologous linker, where each monomer domain specifically binds to a target molecule, (3) a polymucleotide encoding the multimer selected from the novel method; and (4) identifying hetero-immuno multimers that bind to a target molecule, (5) providing a library of monomer domains for affinity to a first target molecule, (6) screening the library of monomer domain that binds to at least one target molecule; (7) identifying at least one monomer domain that binds to at least one target molecule; (8) identifying at least one monomer domain that binds to at least one target molecule; (9) linking the identified immuno-domain with the identified monomer domains to form a library of multimers of multimers comprising at least two domains (h) screening the library of multimers of multimers are useful for identified monomer domains; (h) screening the library of multimers comprising at least two domains; (h) screening the library of multimers of a multimer that binds to the first target molecule; molecule in a subject. The methods can also be used for selecting and optimising properties of discrete monomer domains and/or immuno-domains to create multimers. The multimers are useful for identifying multimers that binds to the first target molecule is a negation of selecting and optimising properties of the target molecule. The polynucleotide, polypeptide and/or multimers of the target molecule. The polynucleotide, polypeptide and/or multimers of present sequence is a human LDL (low density lipoprotein) class Adomain used to design a library of Adomain multimers or treating a library of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This invention relates to a novel method for identifying monomers and multimers that bind to a target molecule. Specifically, it refers to the generation of combinatorial libraries by screening a library of monomer and or immunodomains to identify affinity for a target, and furthermore and or immunodomains to identify affinity for a target, and furthermore linking the identified monomer domains to a second monomer domain to form a library of multimers that still exhibit the ability to bind to the first target molecule. The present invention refers to monomer domains selected from the group consisting of EGF, EF, cadherin, C-type lectin, commoner/ multimer libraries is useful for creating antagonists to a carget molecule, as well as for detection and other affinity based assays, such that the identified molecules can be used to increase the serum half-life of a molecule in the blood or for treating/ preventing a disease associated with the target molecule. In addition, they exhibit immunosuppressive activities and are useful for lowering the immune response in a mammal. This peptide sequence is a human low density component (LDL) receptor class A-domain peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thrombin; factor Xa; cleavage site; receptor; GPIIbIIIa; blood; clotting; infarction; stroke; platelet aggregation; leech.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Decorsin (AAR95440), from the leech Macrobdella decora, acts as a potent antagonist of the platelet glycoprotein IIb-IIIa. 2 Gene cassettes (AAT15273 and AAT15274) respectively coding for the N-terminal (AAR95441) and C-terminal (AAR95442) portion of decorsin can be fused to an association segment used in a novel method for the targetted heteromulation of recombinant proteins to multi-functional complexes. A multivalent decorsin complex combined with an anti-fibrin antibody fragment can act as a powerful antithrombotic agent
                                                                                               Decorsin has three disulfide bonds in its native (i.e. unreduced) form. Mol. wt. is less than 14.4 kD (SDS-PAGE) and 4384 D, calculated on the reduced protein. Decorsin is about 27 times more potent than the pentapeptide GRGDV. A peptide at least 70%, pref. 80%, homologous to indicated peptide 1 and pref. indicated peptide 2 is functional as inhibitor of platelet aggregation. The prod. binds to the GPIIDIII receptors so prevent binding of fibrinosen to platelets. It can be administered therapeutically (esp. to provide a concn. of InM-50 microM) stroke, etc.), opt. together with a fibrinolytic agent). ```
The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a

reactive group (II) (e.g. succinimidyl and maleimido groups) attached to

a less therapeutically active amino acid region (IV), which covalently

bonds with amino/Pydroxyl/thiol groups on blood components to form a

peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth

c actors and neurotransmitters, to protect them from peptidase activity in

vivo for the treatment of various disorders. Endogenous therapeutic

peptides are not suitable as drug candidates as they require frequent

c administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or

reduces the action of peptidases to increase length of activity (half

ilfe) and specificity as bonding to large molecules decreases

intracellular uptake and interference with physiological processes.

AAB90829 to AAB92441 represent invention

ecomprised to the present invention and be used in the

exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                 Protection, endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

AAW20043 shows human decorsin, a platelet aggregation inhibitor, flanked by residues of surrounding linker peptides. The sequence is the product of an expression cassette that was incorporated into a larger DNA cassette as a C-terminal functional domain. The larger cassette comprises, in 5' to 3' direction, a 1st functional domain; a 1st linker sequence; a multimerisation device; a can linker sequence; and a 2nd church cassette comprises, in 5' to 3' direction, a 1st functional domain; a 1st linker comparies in 5' to 3' direction, a 1st functional domain; a 1st linker comparies in 5' to 3' direction, a 1st functional domain; a 1st linker sequence; and a 2nd church cassemple, bind to a metal complement of a nother protein or bind to a metal complement of an example, bind to a defined target, catalyse a reaction, block a receptor binding site, inhibit the action of another protein or bind to a metal con, multimerisation domains from p53, platelet factor 4, thrombospondin, conditions associated factors and cartilage oligomeric protein may be used. The multifunctional proteins can be prepared using the assembled protein excompanisms, even though the molecular weight of the assembled protein exceeds that of the proteins commonly expressed in bacteria. They have low immunogenicity in humans and carry two or more functions in a single multimeric structure. Use of a combination of in vivo expression and in vitro synthesis overcomes prior art problems due condifications for different polypeptides in different hosts
